

Problem 1:  $\text{length}(\text{elements}) == \text{size}$

base case:  $\text{elements} := \text{Nil}[A] \Rightarrow$   
 $\Rightarrow \text{length}(\text{elements}) == 0$   
 $\text{size} := 0 \quad \vdash \Rightarrow$

$\Rightarrow \text{length}(\text{elements}) == \text{size}$

step case:

We consider  $\text{length}(\text{elements}) == \text{size}$

$\rightarrow$  for push:  $\text{length}(\text{elements})$  increases by one  
 $\text{size} := \text{size} + 1 \quad \vdash \Rightarrow$   
 $\Rightarrow \text{length}(\text{elements}) == \text{size}$

$\rightarrow$  for pop:  
• If the list is empty nothing changes  
• If the list is not empty:  
 $\text{length}(\text{elements})$  decreases by one  
 $\text{size} := \text{size} - 1$

$\Rightarrow \text{length}(\text{elements}) == \text{size}$

## Problem 2:

a) weak class invariant:  $\text{today}, \text{yesterday}(), \text{tomorrow}() = \text{today}$

```
fun yesterday(): Date = {  
    if (day > 1)  
        return new Date(year, month, day-1);  
    if (month > 1)  
        if (month % 2)  
            if (month == 3)  
                if (year % 4)  
                    return new Date(year, 2, 28);  
                return new Date(year, 2, 29);  
            return new Date(year, month-1, 30);  
        return new Date(year, month-1, 31);  
    return new Date(year-1, 12, 31);  
}
```

```
fun tomorrow(): Date = {  
    if (month == 2 && day == 29)  
        return new Date(year, 3, 1);  
    if (month == 2 && day == 28 && year % 4)  
        return new Date(year, 3, 1);  
    if (day < 30)  
        return new Date(year, month, day+1);  
    if (day == 31)  
        if (month == 12)  
            return new Date(year+1, 1, 1);  
        return new Date(year, month+1, 1);  
    if (month % 2)  
        return new Date(year, month, 31);  
    return new Date(year, month+1, 1);  
}
```

Q) X: Priority Queue

x.enqueue(m).dequeue() = m (strong class invariant)

```
fun enqueue (x: int): unit = {  
    data = data :: x;  
}
```

### Problem 5.3:

#### Base Case:

$$\begin{array}{ll} 0 + m = m & - \text{zero-left} \\ m + 0 = m & - \text{zero-right} \end{array} \quad \Bigg| \Rightarrow$$

$$\Rightarrow 0 + m = m + 0$$

#### Step Case:

Let's assume that  $m + n = n + m$

then:

$$\begin{array}{ll} S(m) + n = S(m+n) & - \text{succ-left} \\ n + S(m) = S(n+m) & - \text{succ-right} \\ m + n = n + m \Rightarrow S(m+n) = S(n+m) & \end{array} \quad \Bigg| \Rightarrow$$

$$\Rightarrow S(m) + n = n + S(m)$$

$$\Rightarrow m + n = n + m, \quad \forall m, n \in \mathbb{N}$$
